Determination of Patent Term Adjustment under 35 U.S.C. 154 (b)

(application filed on or after May 29, 2000)

The Patent Term Adjustment to date is 661 day(s). If the issue fee is paid on the date that is three months after the mailing date of this notice and the patent issues on the Tuesday before the date that is 28 weeks (six and a half months) after the mailing date of this notice, the Patent Term Adjustment will be 661 day(s).

If a Continued Prosecution Application (CPA) was filed in the above-identified application, the filing date that determines Patent Term Adjustment is the filing date of the most recent CPA.

Applicant will be able to obtain more detailed information by accessing the Patent Application Information Retrieval (PAIR) system (http://pair.uspto.gov).

Any questions regarding the Patent Term Extension or Adjustment determination should be directed to the Office of Patent Legal Administration at (703) 305-1383. Questions relating to issue and publication fee payments should be directed to the Customer Service Center of the Office of Patent Publication at (703) 305-8283.

DETAILED ACTION

Allowable Subject Matter

- 1. Claims 1-31 are allowable over the prior art of record.
- 2. The following is an examiner's statement of reasons for allowance:

As per independent claims 1,12,22,24, the recited limitations pertaining to the generation of mixture components (which are derived from the noise channel vectors -- pp 22 of the specification), in combination with the generation of correction vectors, (as detailed on pp 19, lines 1-14 of the specification), is not explicitly taught by the prior art of record.

With respect to the prior art of record, it is old and well known to take measurements of "clean" and "noisy" speech channels, and to use that information to improve the accuracy of the speech recognition channel. For example, under applicant's admitted prior art (pp 3 of the specification), noisy correction vectors are generated by subtracting noise channel vectors from clean channel vectors, and then applying this correction vector to a training signal or test signal. In other areas of prior art, noisy feature vectors are compared to clean channel feature vectors to identify a mixture component that best aligns with the feature vector, however, such alignment is not ideal since the comparison is to clean channel feature vectors, not noisy channel feature vectors. One detailed example of the prior art of record is Trompf et al (5758022), wherein stress related variations in speech vectors are compared to stress-free speech vectors for training the neural network, and also applying a third type of speech vector to account for background

noise (col. 3 lines 40-55). Moreno et al ("Multivariate Gaussian Based Cepstral Normalization for Robust Speech Recognition, 1995, IEEE), teaches adding to the mean and variance of clean speech vectors the mean and variance components of noisy speech vectors to calculate a compensation factor to account for the noise background during actual speech recognition (pp 138), with the correction terms being in the form as shown on pp 139, equations 12, and 13. However, these correction terms are not based upon derivation from noisy speech channels, nor of the same structure as covered in the scope of the recited claim language above. Furthermore, it would not have been obvious to one of ordinary skill in the art of speech noise modeling to modify the teachings of the prior art of record to obtain the recited claim limitations of the independent claims as listed above.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
